

Measuring Organizational Readiness Through Workforce Analytics

Building AI-enabled Organizational Analytics with Christina Tangora Schlachter, PhD

The Challenge

Organizational transformations often rely on intuition when evaluating workforce readiness and organizational impact. Leaders lacked objective ways to identify workload imbalances, management capacity, organizational equity, and emerging risks before changes were implemented.

The challenge was to combine workforce analytics with behavioral insights to help leaders make more informed transformation decisions.

My Approach

Designed a workforce analytics framework that integrated quantitative organizational metrics with qualitative stakeholder insights to provide an early view of transformation risk. The framework included:

- Workforce workload and organizational health analytics
- Span of control and leadership capacity analysis
- Workload equity and fairness assessments
- Geographic and organizational distribution analysis
- Predictive dashboards highlighting emerging organizational risks

Business Impact

- Developed an organizational analytics framework to assess workforce readiness.
- Identified organizational hotspots related to workload, leadership capacity, and structural equity.
- Enabled proactive leadership decisions through predictive dashboards and risk indicators.
- Increased transparency and confidence in transformation planning.

Data identifies patterns.
People determine priorities.

“

The best transformation decisions are informed by both data and human insight.

”

Key Insight

The most valuable transformation metrics aren't financial, they're organizational. By combining workforce analytics with behavioral insights, organizations can identify

change risks earlier, make more equitable decisions, and improve employee confidence throughout transformation.
